Univariate Visualizations Boxplots

Age_std :
14.778207

Weight_std :
13.803452

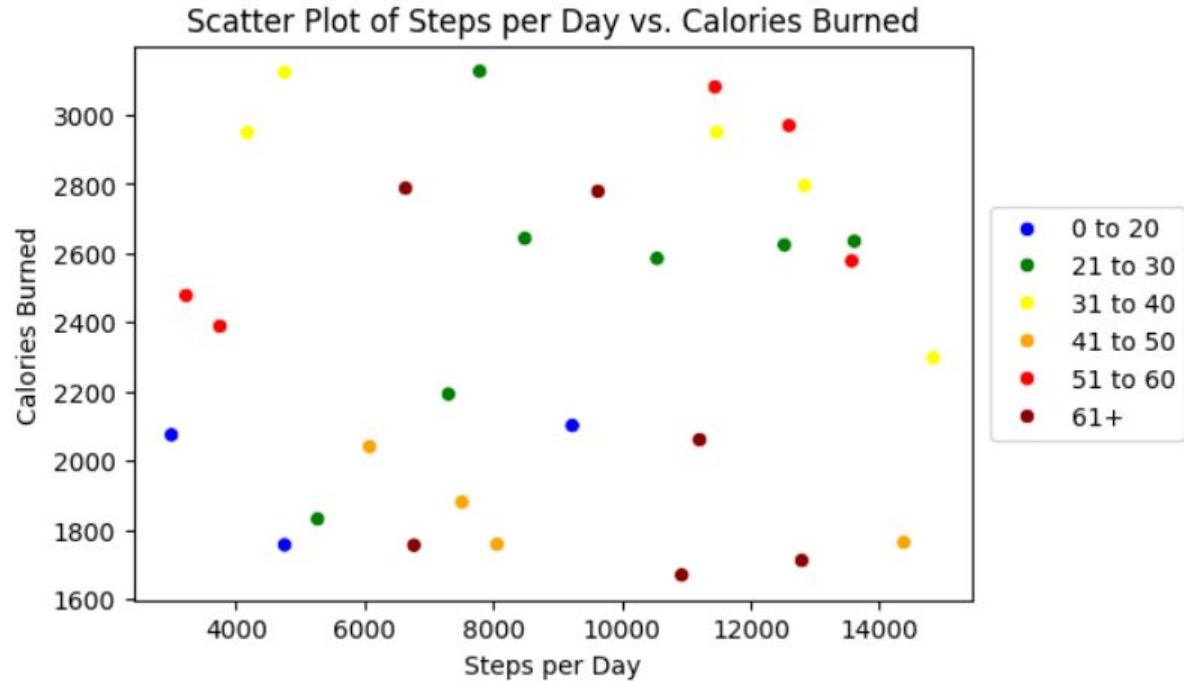

Height_std :
13.772684

StepsPerDay_
std :
3619.636203

CalBurned_std
: 3619.636203

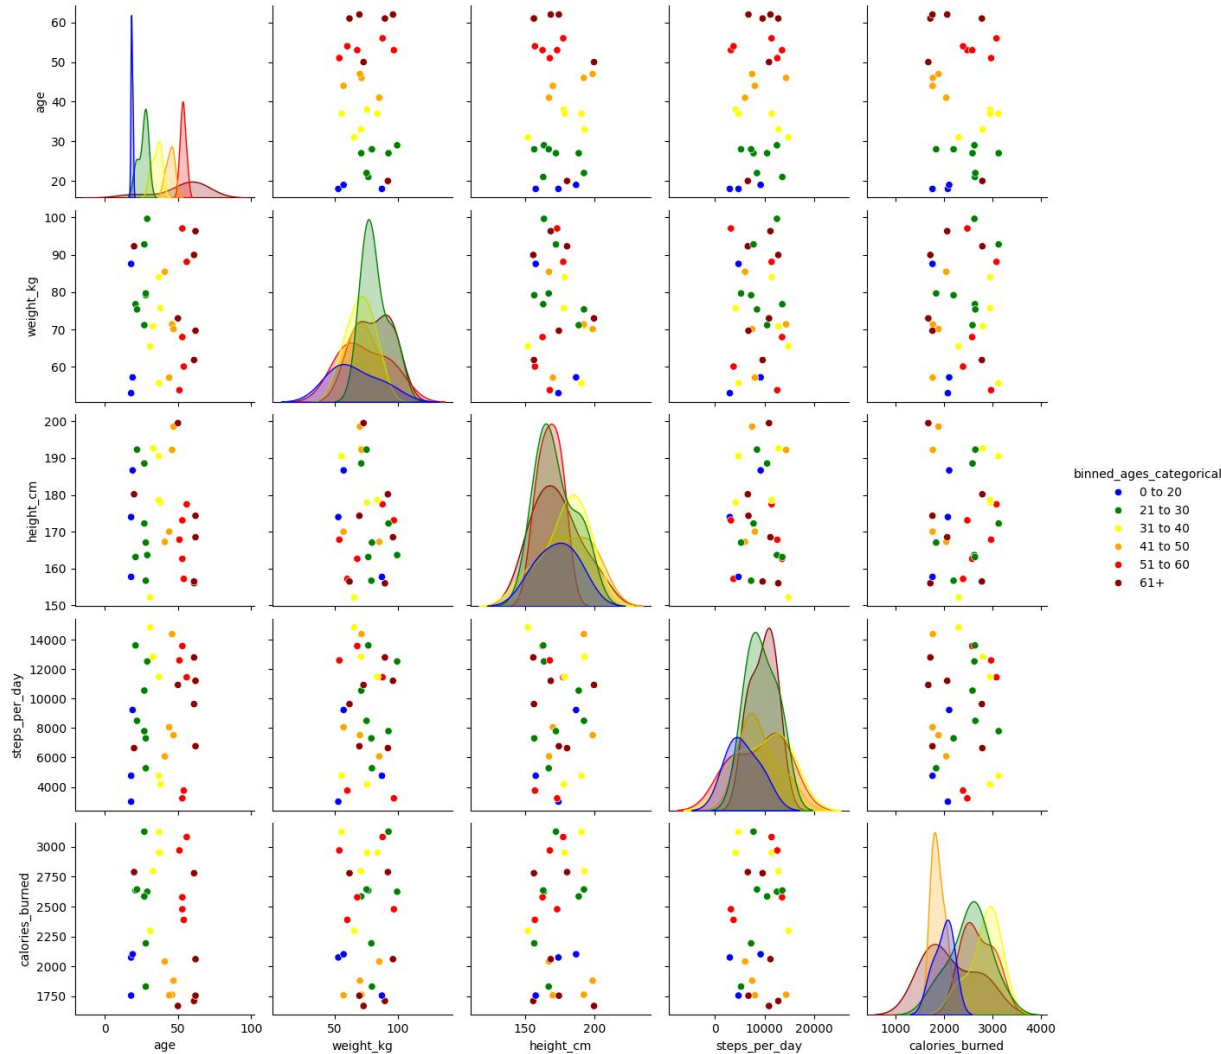

Multivariate Variables

- No strong association between calories burnt and steps walked per day
- Different age distribution shows no pattern either

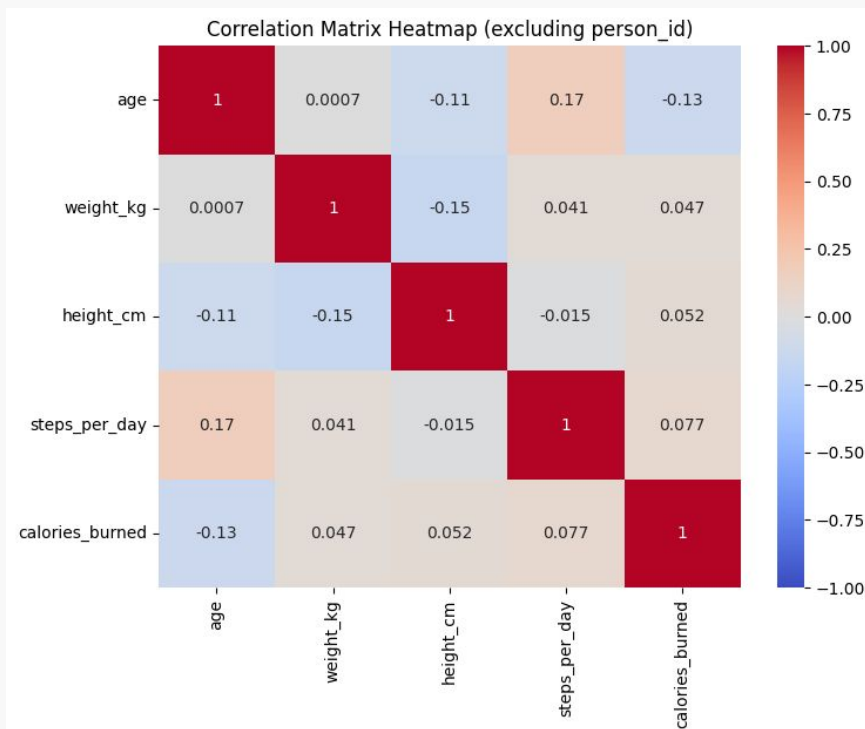

Multivariate Variables

- 21 to 30 y/o's weighed the most
- 21 to 30 and 61+ y/o's took the most steps per day
- 41 to 50 y/o's burnt the most calories

Correlation Matrix Heatmap

- Exclude 'person_id' since this is an identifier, not a meaningful value for correlations.
- Mix of positive and negative correlations, none very strong in absolute terms.
- But what about relative to one another?
Which values are the most/least correlated?

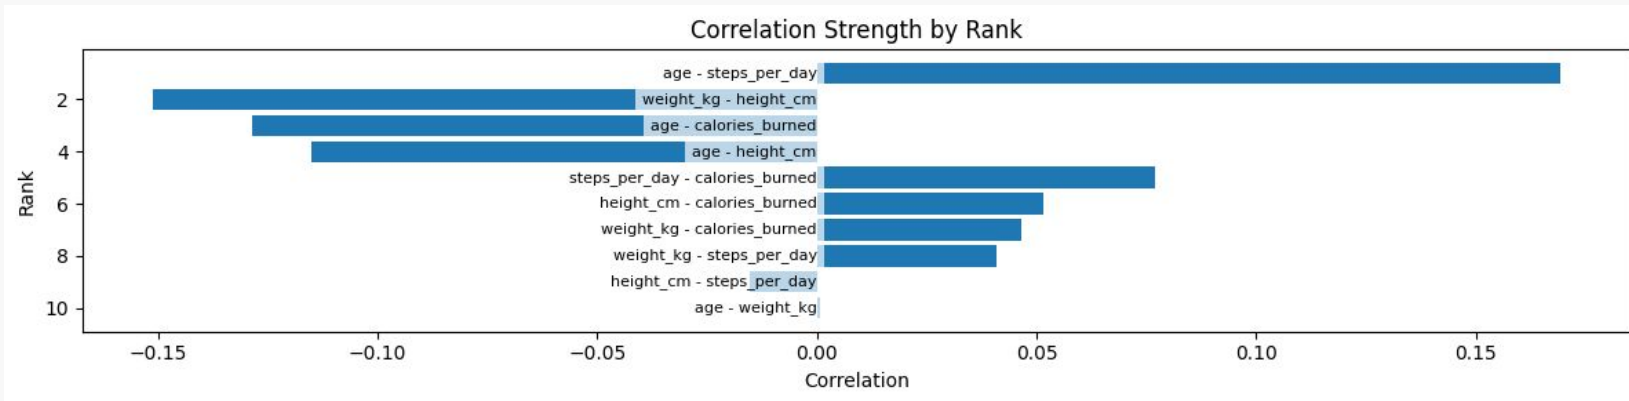

Correlations by Rank

- Rank by absolute value
- Hard to understand at a glance
- Visualize by plotting values using barh (horizontal bar plot)

Rank	Variable 1	Variable 2	Correlation
1	age	steps_per_day	0.169239
2	weight_kg	height_cm	-0.151204
3	age	calories_burned	-0.128699
4	age	height_cm	-0.114970
5	steps_per_day	calories_burned	0.076832
6	height_cm	calories_burned	0.051617
7	weight_kg	calories_burned	0.046506
8	weight_kg	steps_per_day	0.040808
9	height_cm	steps_per_day	-0.015362
10	age	weight_kg	0.000703

Correlations by Rank, continued

- Strongest: age-steps per day
- Weakest: age-weight
- Positive correlation of steps per day-calories burned makes sense
- Height- and Weight-calories burned also positively correlated—larger people burn more calories
- Surprising negative correlation in weight-height
